

## Project information

### Keywords

Sustainable harvest, Climate change, Food web approach

### Project title

Sustainable management of renewable resources in a changing environment: an integrated approach across ecosystems (SUSTAIN)

### Year

2018

### Project leader

John-André Henden

### Geographical localization of the research project in decimal degrees (max 5 per project, ex. 70,662°N and 23,707°E)

Norway

### Participants

Project leader: John-A Henden

Participants from UiT, NTNU, UiO, NINA and NP along with international partners from USA, Denmark and France

From local institutions: Torkild Tveraa and Audun Stien at NINA, Rolf A Ims, Nigel G Yoccoz, Sandra Hamel and John-A Henden at UiT and Eva Fuglei and Åshild Pedersen at NP

### Flagship

Terrestrial

### Funding Source

NFR - ecosystems call. Funded until the end of 2019.

## Summary of Results

The project had its start in January 2016 with a user panel meeting (cf. The Strategic Foresight protocol) where all the researchers in the project, end-users and stakeholders met to discuss what should be the focus of the research within the project. This meeting initiated the contact between the different interest-groups within the different focal case-studies in the project, which spearheaded further discussions and meetings throughout 2016-2018. This has ended up in agreed-upon focus for the scientific work, such that its focus has relevance for end-users and stakeholders in the future. The additional funding that the project received from FRAM ensured that researchers from NINA in Tromsø could attend these meetings as well as be actively involved in the ongoing discussions, analyses and writing of scientific publications. This has been vital, given their long-term research and knowledge with regards to reindeer husbandry in Norway (Reindeer case study), one of the main end-users/stakeholders in the project, as well as Audun's long-term research and knowledge from Svalbard in the high-arctic (Svalbard case study).

Both have also been vital actors in the work on the evaluation of management actions implemented to change the fate of endangered Lesser white-fronted goose in Norway. This work has shown that the increase in the population of geese in Finnmark after the red fox decimation program was initiated, is not likely due to the management action, but due to indirect food web interactions with small rodents and availability for predators of reindeer carcasses, both of which has increased the last decade. This work highlights the importance of a proper evaluation of management actions, by assessing possible other drivers of change (food web approach).

Both researchers have also been part of the work on drivers of change in willow ptarmigan dynamics the last decades. This work shows that the population growth rate of ptarmigan has decreased since the start of the millennium (2000). By adopting a food web approach, we have shown that climate change acts on ptarmigan both directly (local climate) and indirectly (through small rodents, carcasses and predators). One of the strongest drivers have been the effect of delayed onset of winter, likely leading to higher predation pressure on ptarmigan due to a mismatch in plumage color and snow cover.

## Master and PhD-students involved in the project

In Tromsø: Filippo Marolla (PhD) and several master students.

For the Management

See summary of results and communication section.

NB: Results are continuously communicated to the end-users and stakeholders through the project and through meetings and workshops.

Budget in accordance to results

All the funding has been used on the vital participation of the two NINA researchers, as planned.

The additional funding from the FRAM centre has assured the crucial involvement and participation of two researchers at NINA in Tromsø, i.e. Torkild Tveraa and Audun Stian, costs which was not included in the project financed by the NRC. Flagship funding have therefore complemented the funding from NRC and assured that the researchers from NINA have had some research time and mental

involment devoted to the project.

Could results from the project be subject for any commercial utilization

No

Conclusions

The additional funding that the project recieved from FRAM ensured that researchers from NINA in Tromsø could attend meetings and be actively involved in the ongoing discussions and evolution of the projects fokus. Lately their involmment in the analyses and writing of scientific publications have been a vital contribution to the project.. This has been vital, given their long-term reseach and knowledge with regards to reindeer husbandry in Norway, one of the main end-users/stakholders in the project, as well as Auduns long-term research and knowledge from Svalbard in the high-arctic.
